Learning Objective 1

Identify the role of electroceutical treatment in neurologic and psychiatric disorders.

Central question in neuroscience:
How do neural circuits determine behavior?

*How can we normalize dysfunctional circuits
using external stimuli?*

Electricity in Medicine

Medicinal Electric Fish

Ancient Egyptian and Roman physicians treated a range of painful conditions. Scribonius Largus published use of torpedo fish to treat headache.

2500 BC

45 AD

Electrotherapy

Benjamin Franklin
Luigi Galvani
Giovanni Aldini
G.B.C. Duchenne

1750 - 1850

Electroconvulsive Therapy

Ugo Cerletti
Lucio Bini
Friedrich Meggendorfer

1934 - 1944

Implanted Stimulators

Spinal cord stimulator
Cochlear implants
Retinal implants
Deep brain stimulators

1960 - present

Rosierucian Egyptian Museum
San Jose, California

What have we learned in 4,500 years?

2500 BC
Medicinal Electric Fish

2020 AD
Implanted Electric Stimulators

Electroceutical Science

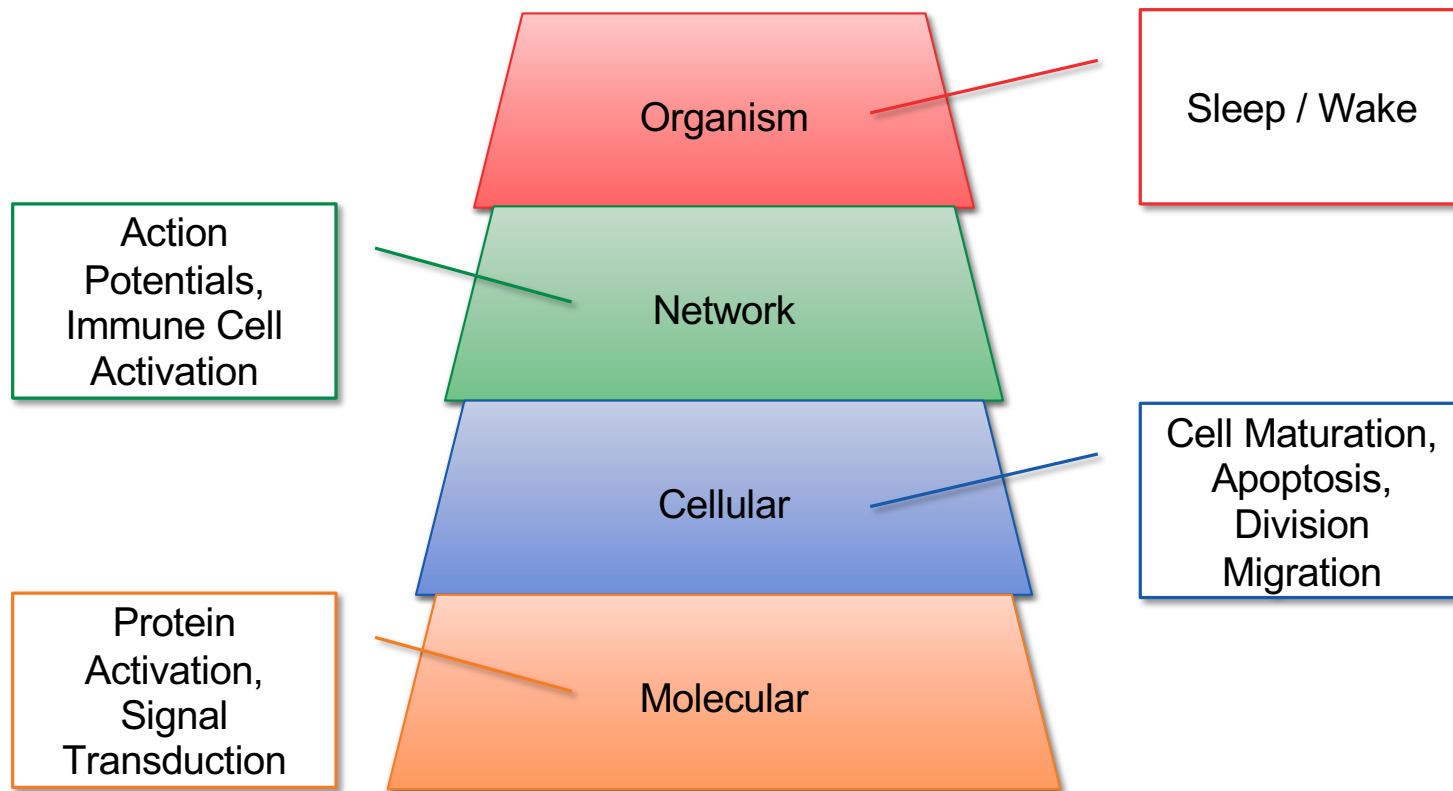

What are the mechanisms of action?

What are the spatial and temporal scales of effect?

How is optimal dose profile determined?

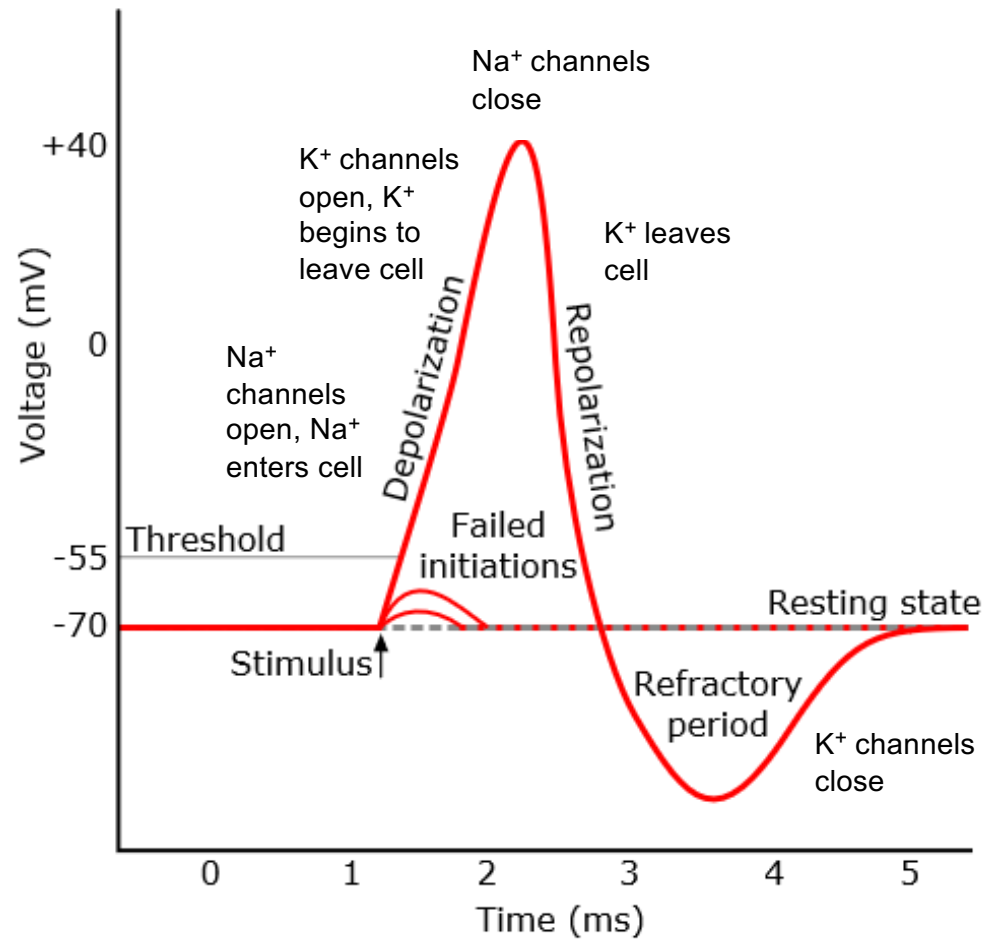

Charge-Sensitive Biological Switches

Voltage-sensitive membrane proteins regulate ion fluxes and generate the action potential

The Action Potential

Electric field effect on cells is highly dependent on stimulus frequency

Alignment & Migration
Actin Filaments/Adhesion

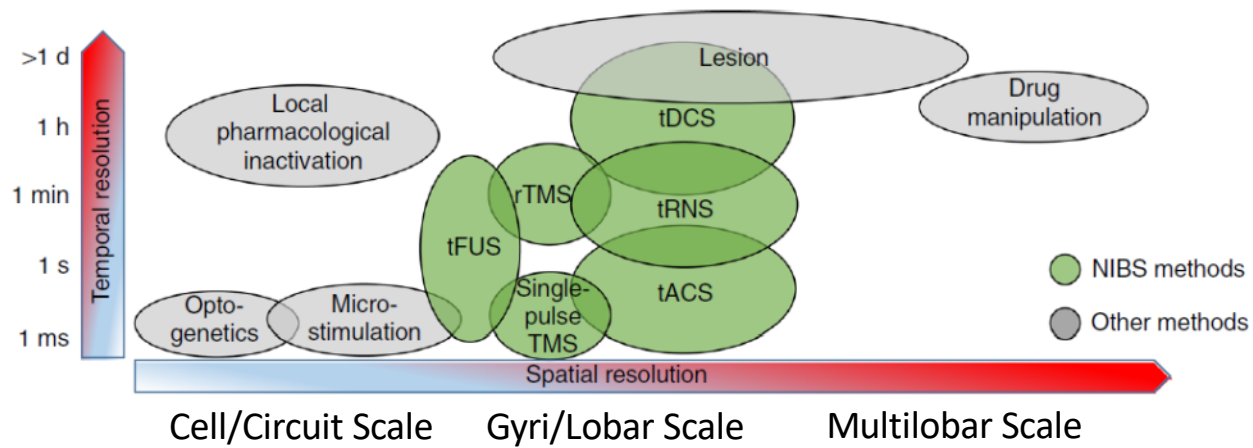

Depolarization & Hyperpolarization
Voltage-Sensitive Ionic Channels

Mitotic Inhibition & Apoptosis
Microtubule Assembly

Temporal and spatial scales of neural stimulation techniques

A new class of micro-electrodes – ultra-flexible & biocompatible

Flexible electrode (red)
Neurons (yellow)
Vascular network (green)

Stable *in vivo* recording from individual neurons
long-term (> 1 year)

Chong Xie, PhD
Rice University

Luan L, et al. *Sci Adv* 2017;3(2):e1601966.

Electroceutical Science - Main Questions

What are the mechanisms of action?

What are the spatial and temporal scales of effect?

How is optimal dose profile determined?

Electrical stimulation can induce switching between pathological and healthy states

State 1	Stimulation	State 2
Cardiac arrhythmias	Cardiac Conduction System	Normal sinus rhythm
Parkinsonian tremors	Subthalamic Nucleus	No tremors
Epileptic seizures	Thalamocortical Circuits	Normal brain activity
Migraine	Trigeminal Nerves	No headache

State switching

Goldilocks Principle

Stimulus Energy

Too Little Energy

- Failed outcome
- Wasted energy

**Just
Right**

Too Much Energy

- Decreased battery life
- Off target effects
- Damaged tissue

Epilepsy

Prevalence (US):

- 2.3 million adults and over 450,000 children
- Diagnose roughly 150,000 new cases each year
- Financial burden - \$9.6 billion in 2009

Treatments for Epilepsy

- Drug therapies
- Surgery
- Electrical Stimulation

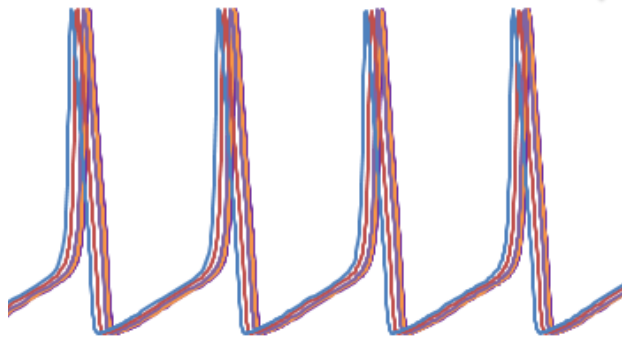

Neuronal synchronization underlying epilepsy

Crunelli V, Leresche N. *Nat Rev Neurosci.* 2002;3(5):371-382.

Synchronized Activity

Responsive Neural Stimulation (RNS)

NeuroPace RNS System

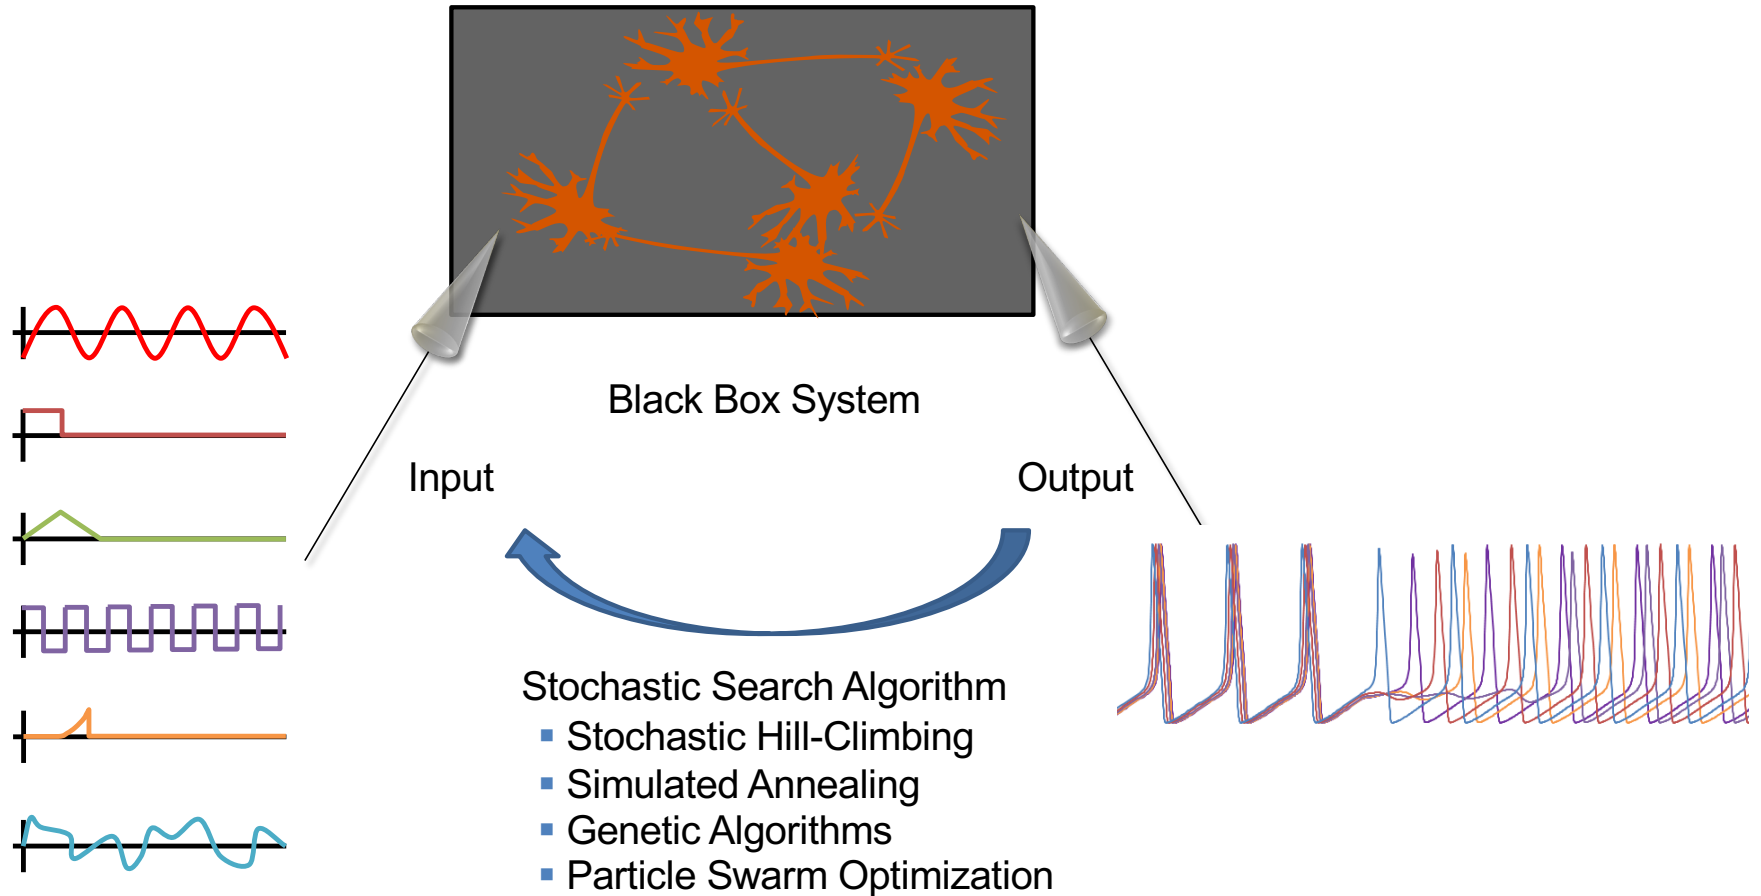

RNS suppression of seizure

- Efficacy ~50%
- Off target effects
- Battery life

How can we optimize the stimulus waveforms?

Search Algorithms

Optimal stimulus to desynchronize five coupled neurons

Optimized stimulus: $24.43 \mu\text{J}/\text{cm}^2$

Rectangular pulse: $154.88 \mu\text{J}/\text{cm}^2$

Computed optimal stimulus waveforms

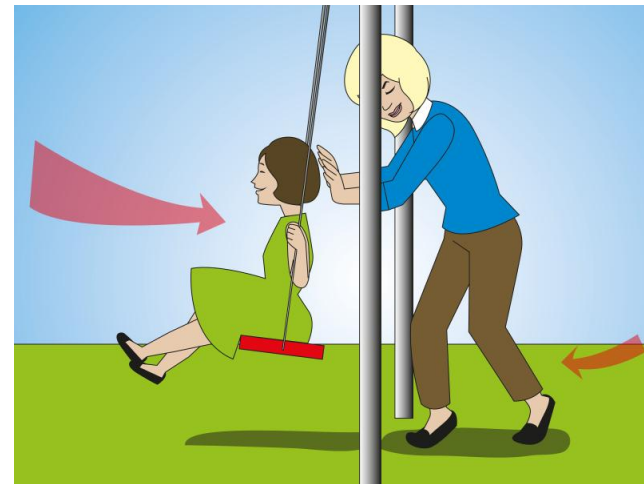

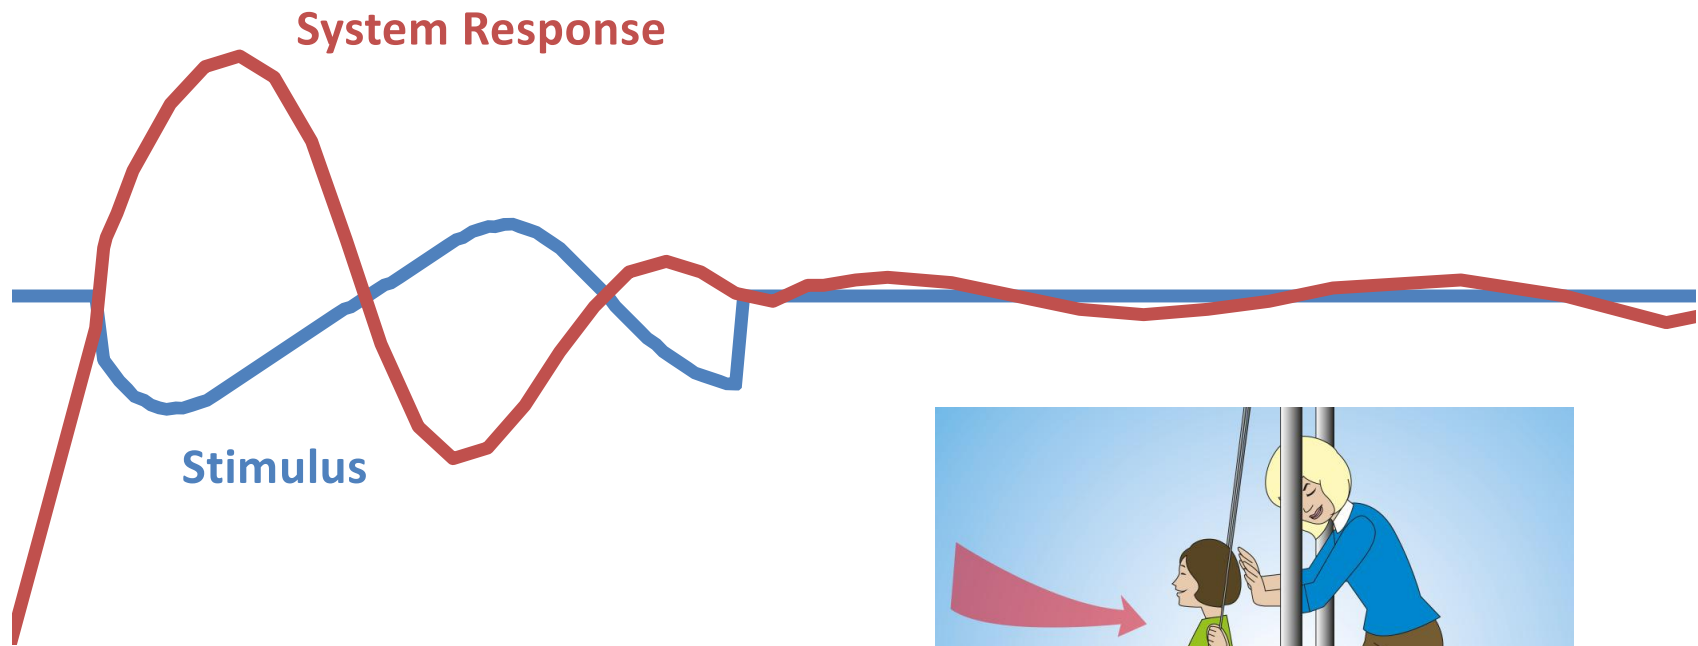

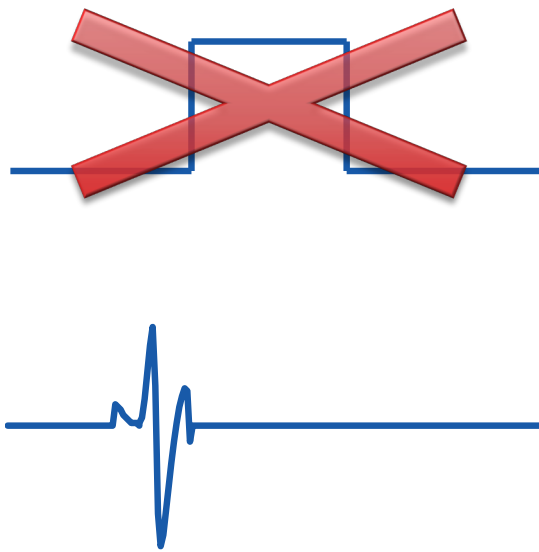

Illustration of counterbalancing mechanism

Tailoring therapy to the dysfunctional circuit

Waveform shape

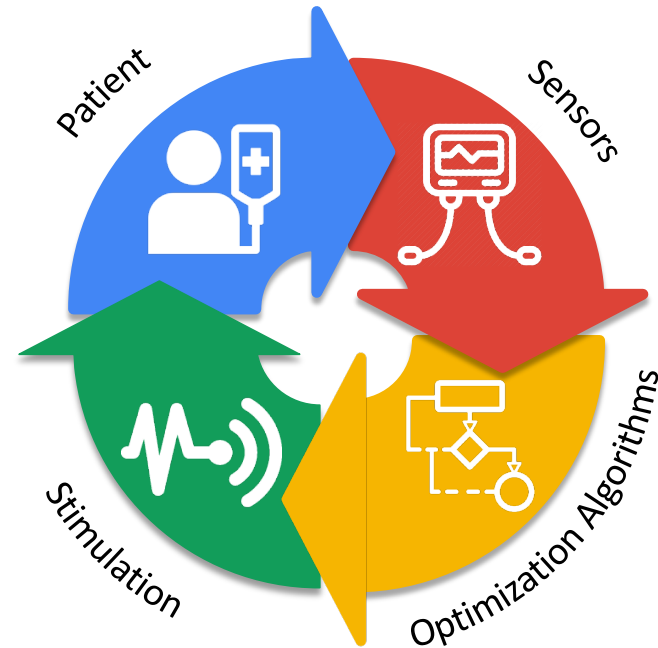

Stimulus timing

Electroceutical Principles

- Mechanisms of action
- Spatial and temporal scales of effect
- Optimal dose profile
